

SALES FUNNEL MARKETING

Human Focused. AI Optimized.

PREMIUM IMPLEMENTATION DOSSIER

Steal Our CEO's AI Workflow

A behind-the-scenes operating blueprint for the daily AI system we use to brief decisions, turn conversations into action, prep sales calls, and protect owner focus.

PRIVATE OPERATING SYSTEM BLUEPRINT

The exact categories behind the post, organized into a build sequence an owner can actually run.

7

daily workflow

14d

implementation sprint

Free today. Built like a paid strategy brief.

Use it to build your own CEO assistant workflow.

What You Are Actually Getting

This is not a tool list.

It is the daily operating rhythm behind the Facebook post: what gets briefed, what gets summarized, what gets researched, what gets delegated, and where human judgment stays in control.

01

The assistant prepares the room

Inbox, meetings, sales calls, client topics, and priority decisions are organized before the owner spends attention.

02

The owner still makes the call

AI can draft, sort, summarize, and compare. It does not approve replies, make client judgment calls, or publish unchecked work.

03

Every output lands somewhere useful

A meeting becomes tasks. A voice note becomes a post outline. A client topic becomes a checked idea. A sales call becomes a sharper diagnosis.

The value is not automation. The value is fewer dropped balls.

Most businesses do not need a bigger software stack first. They need a repeatable decision system that tells the owner what matters, what can wait, and what needs human attention now.

The Seven-Part CEO Workflow

The same seven ideas from the comment thread, rebuilt as a usable operating system.

7. Priority filter

At the end of the day, the task list is sorted by what actually moves money this week. Everything else waits, gets delegated, or gets removed.

What Each Workflow Produces

A paid system is defined by outputs, not vibes. These are the outputs the assistant has to create.

WORKFLOW	AI PREPARES	HUMAN APPROVES	FINAL ASSET
Inbox	Urgency rank, summary, draft response	Tone, promise, timing, send/no-send	Ready-to-review replies
Meetings	Summary, decisions, tasks, open loops	What matters, who owns it, deadline	Action list
Topics	Client-specific content angles	Accuracy, usefulness, relevance	Approved topic queue
Dashboard	Insight status and exceptions	What needs client-facing action	Issue list
Sales prep	Business, reviews, website, social activity	Diagnosis and call strategy	Leak notes
Voice notes	Messy thought converted to structure	Priority and final wording	Task or outline
Priorities	Money-moving sort order	Decision on focus	Today list

Inbox Command Center

If AI can make the owner's inbox calmer without sending anything on its own, adoption gets easier.

INPUT

What Emily reviews

Unread messages, known client context, calendar pressure, owner voice rules, promises already made.

OUTPUT

What Jayson sees

A ranked inbox, a five-line summary, draft replies, and a clear callout for messages that need human judgment.

Prompt Architecture

Role: Act as my executive assistant, not my replacement.

Context: Use my voice rules and previous replies as the standard.

Task: Rank by urgency, summarize what matters, and draft responses.

Guardrail: Do not send, promise, discount, apologize, or escalate without approval.

Output: Urgent now, today, this week, can wait, plus draft replies.

Quality Check

A good inbox brief makes the owner faster in the first three minutes of the day. A bad one creates more review work than it saves.

Meeting Notes Become Commitments

The premium move is not transcription. The premium move is turning a conversation into promises nobody forgets.

STAGE	QUESTION THE ASSISTANT ANSWERS	OUTPUT
Capture	What did the people actually say?	Transcript and clean summary
Extract	What decisions, promises, objections, and blockers appeared?	Structured issue list
Assign	Who owns the next move?	Owner, due date, and task
Follow up	What should the client or team receive?	Draft note or next-step email

The rule

Every meeting must leave behind decisions, promises, next actions, and open questions. If the AI summary does not produce those four categories, it is just prettier notes.

Client Intelligence Engine

Topics and dashboards are where the workflow starts looking expensive because it catches problems before the client does.

TOPIC MINING

Find what people would care about

Pull client-specific content angles from notes, posts, reviews, local context, questions, objections, and seasonal demand.

DASHBOARD REVIEW

Catch the quiet issues

Review whether insights are running clean, what looks stale, what needs attention, and which client might feel under-served.

Review Standard

CHECK	PASS STANDARD
Accuracy	Can a client or customer verify this without embarrassing us?
Usefulness	Would the audience care, save it, ask about it, or act on it?
Specificity	Does this sound like this business, not any business?
Actionability	Does it become a post, call note, client idea, or follow-up task?

Sales Prep And Voice Capture

This is where AI stops feeling like content software and starts feeling like leverage for the owner.

Before the sales call

Emily pulls the business, reviews, website, and last 90 days of posts. The owner walks in already knowing where the funnel is leaking.

Output: leak notes, likely objections, missed conversion points, and the strongest opening question.

Between appointments

Jayson talks into his phone. By the time he parks, the messy thought has become a task list, post outline, client note, or follow-up action.

Output: captured idea, cleaned structure, next owner, and recommended next step.

The expensive part

You are not buying AI to write faster. You are buying back the moments where good ideas normally disappear because the owner was driving, walking into a meeting, or trying to remember what mattered later.

OWNER LEVERAGE

Capture before polish

The system should accept messy input, preserve intent, and turn it into structured work. Perfect input should not be required.

Four Premium Prompts To Install First

Use these as starting prompts. The real value comes from adding your voice rules, client context, and examples.

1

Inbox Brief

Review these emails. Rank by urgency, summarize what matters, identify anything that needs my decision, and draft replies in my voice. Do not send anything.

2

Meeting Extract

Turn this transcript into decisions, promises we made, promises they made, blockers, deadlines, owners, and the next three actions.

3

Client Topic Pull

Review these client notes and recent posts. Suggest five topics their audience would care about, then flag anything requiring fact-checking.

4

Money Filter

Sort this task list into: moves money this week, protects current clients, can wait, should delegate, and should delete.

14 Days To A Working Version

This gives the owner a real path. Not theory. Not a software shopping list. A build sequence.

DAYS	BUILD	DEFINITION OF DONE
1-2	Voice and guardrails	Assistant role, no-send rules, examples of tone
3-4	Inbox brief	Daily urgency summary and draft reply format
5-6	Meeting handoff	Transcript turns into decisions, promises, and tasks
7-8	Voice-note capture	Phone notes become task or content outline
9-10	Client intelligence	Topic review and dashboard exception list
11-12	Sales prep	Pre-call leak review checklist
13-14	Priority filter	Weekly money-moving task sort

Install one workflow at a time. A working daily habit beats a beautiful unused system.

LAUNCH CHECKLIST

Build This In Your Business

A paid consultant would start here: define the operating standard before chasing automation.

- ☐ Write the assistant role and what it is never allowed to do.
- ☐ Add five real examples of your voice and decision style.
- ☐ Choose where transcripts, tasks, and notes land.
- ☐ Define action, decision, promise, blocker, and deadline.
- ☐ Create the pre-call research checklist.
- ☐ Create the client-topic accuracy and usefulness check.
- ☐ Build the weekly money-moving priority review.
- ☐ Require human approval before anything leaves the building.
